Research Experience Program Advertising Text

PROJECT TITLE: Decision-Making in Source Memory

This research project investigates how people remember the context of events that they experience. In order to investigate this, you will be asked to come into a testing room in the Redmond Barry Building and be shown a series of words which will be positioned along a circle on a computer screen. After a delay, you will then be shown a list of words and be asked to identify which words were previously presented. For words which were previously presented, you will also be asked to reproduce the location along the circle that the word was originally shown in.

Participation in this project runs for two sessions, with each session estimated to take between 45 minutes and 1 hour to complete. Each session is worth one credit for REP participation.
